

AI-Powered Investment Recommendation Agent

Challenge

Investors struggle to analyze market trends, assess risks, and choose suitable investments because financial information is scattered and personalized guidance is limited.

Objective

Build a multi-agent AI solution using IBM BOB, IBM watsonx.ai, IBM Granite Models, and RAG to provide personalized investment recommendations, portfolio analysis, risk assessment, and real-time market insights.

Proposed Solution

The solution employs four AI agents: Investment Knowledge, Portfolio Recommendation, Risk Analysis, and Market Monitoring. A RAG pipeline retrieves trusted financial information from a Vector Index, while IBM Granite generates accurate, context-aware responses. An interactive dashboard visualizes portfolio performance, asset allocation, expected returns, and risk metrics.

IBM Technologies

IBM BOB • IBM watsonx.ai • IBM Granite-4.0-8B-Instruct • IBM Cloud • Vector Index (RAG) • File Component • Streamlit/React Dashboard

Outcome

A secure, scalable, and intelligent digital investment advisor that delivers personalized, real-time financial guidance.
